Cotton, often referred to as the "white gold" of Azerbaijan, has a long history of production in the country. As potential investors in Azerbaijan require an analysis of the performance of the cotton sector, its main opportunities and risks, this joint sector review of the Food and Agriculture Organization of the United Nations (FAO) and the European Bank for Reconstruction and Development (EBRD) provides a general overview of the sector, followed by an analysis of more specific aspects of cotton production such as economic and financial profitability, agronomic practices, and social and environmental risks. While expanding cotton production presents a number of opportunities, notably in terms of its potential to provide employment in rural areas and its export potential, the report also underlines a number of environmental and social risks related to the growth of the sector.

Climate change effects over the next 25 years will be mixed. Continued changes by mid-century and beyond, however, are expected to have generally detrimental effects on most crops and livestock. As temperatures increase, crop production areas may shift to follow the temperature range for optimal growth and yield, though production in any given location will be more influenced by available soil water during the growing season. Weed control costs total more than \$11 billion a year in the U.S.; those costs are expected to rise with increasing temperatures and carbon dioxide concentrations. Changing climate will also influence livestock production. Heat stress for any specific type of livestock can damage performance, production, and fertility, limiting the production of meat, milk, or eggs. Changes in forage type and nutrient

content will likely influence grazing management needs. Insect and disease prevalence are expected to increase under warmer and more humid conditions, diminishing animal health and productivity.

In an integrated world economy, China's rising food prices will become the world's rising food prices. China's land scarcity will become everyone's land scarcity. And water scarcity in China will affect the entire world. China's dependence on massive imports, like the collapse of the world's fisheries, will be a wake-up call that we are colliding with the earth's capacity to feed us. It could well lead us to redefine national security away from military preparedness and toward maintaining adequate food supplies.

China is playing an important role in global agricultural markets as it emerges from isolation, liberalizes its economy, and experiences rising living standards. Policymakers, analysts, researchers, and the public need information about China's growing, multifaceted role in agricultural markets. This report examines China's recent emergence as a major agricultural importer and its implications for global markets. It analyzes trade patterns employing U.S. and Chinese trade statistics, summarizes alternative projections of future imports, and discusses how Chinese officials are adjusting their strategic approach to agricultural trade as imports grow. A strong agricultural trading partnership has developed between China and the United States that is likely to persist into the future. However, Chinese interventions to preserve self-reliance create volatility and uncertainty that can disrupt markets.

No general history of southern farming since the end of slavery has been published until now. For the first time, Gilbert C. Fite has drawn together the many threads that make up commercial agricultural development in the eleven states of the old Confederacy, to explain why agricultural change was so slow in the South, and then to show how the agents of change worked after 1933 to destroy the old and produce a new agriculture. Fite traces the decline and departure of King Cotton as the hard taskmaster of the region, and the replacement of cotton by a somewhat more democratically rewarding group of farm products: poultry, cattle, swine; soybeans; citrus and other fruits; vegetables; rice; dairy products; and forest products. He shows how such crop changes were related to other developments, such as the rise of a capital base in the South, mainly after World War II; technological innovation in farming equipment; and urbanization and regional population shifts. Based largely upon primary sources, *Cotton Fields No More* will become the standard work on post-Civil War agriculture in the South. It will be welcomed by students of the American South and of United States agriculture, economic, and social history.
